Conclusions

tui architecture

Touch All API

Functions to, stage setup, tuio connections,
gestures, multi-touch, and fiducials
widgets for specific fiducial ids

tuio as3 library

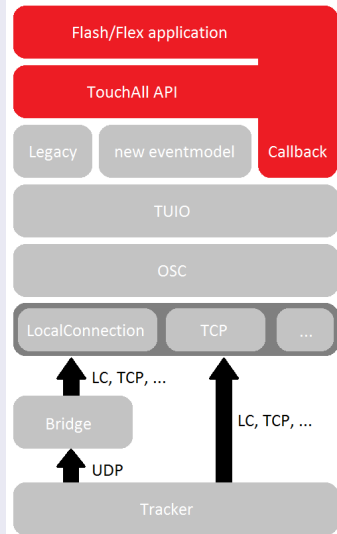

Blob, cursor, object/fiducial events
LocalConnection, TCP, and UDP sockets
OSC and Tuio Protocols

Flex SDK

Gesture, Mouse, and
Keyboard events
Flash/AS3 libraries

AIR 2.* SDK

Stage additional
setup options
UDP support

Conclusions

tui Demos

Conclusions

- The time required in developing applications for multi-touch devices can be shortened using tui.
- tui allows to use fiducials and multi-touch through UDP, TCP, flash LocalConnection all in once.
- ActionbScript-based non-free software alternatives exist, but not with native fiducial support.

Future work

- Development of tools that allow device emulation, for multi-touch, multi-mouse pointer, and platform independent application testing.
- Include in the tui more native widgets for specific fiducials.
- Include in the tui support for 3D object loading and gesture based manipulation.
- Integrate the tui as a module of an 2D/3D Action-Script 3.0 game engine.
